■ Operation timing diagram

● Through-beam type

● Retroreflective/Diffuse/Narrow beam/ BGS reflective type

※The waveforms of “Operation indicator” and “Transistor output” are for Light ON operation.
They are opposite operation for Dark ON operation.

■ Mounting and sensitivity adjustment

◎ For mounting

Please use bolts M3 for
mounting of sensor,
set the tightening torque under
0.5N·m.

◎ Switching of operation mode

Light ON operation		Turn the switching volume of operation mode to end of right(L direction), it is set as Light ON.
Dark ON operation		Turn the switching volume of operation mode to end of left(D direction), it is set as Dark ON.

※For through-beam type, the switching volume of operation mode is built-in the receiver.

◎ Optical axis adjustment

●Through-beam type

1. Place the emitter and the receiver facing each other and supply the power.
2. After adjusting the position of the emitter and the receiver and check their stable indicating range, mount them in the middle of the range.
3. After mounting this unit, check the operation of the sensor and lighting of the stability indicator in both status. (None or sensing target status)

※When the sensing target is translucent or small(under sensing target of '■ Specifications'), it may not be detected by the sensor because the light can penetrate it.

● Retroreflective type

1. Place the sensor and the reflector facing each other and supply the power.
2. After adjusting the position of the sensor and reflector and check their stable indicating range, mount them in the middle of the range. (None or sensing target status)
3. After mounting this unit, check the operation of the sensor and in both status. (None or sensing target status)

● Diffuse/Narrow beam/BGS reflective type

After place a sensing target, adjust the sensor to up or down, right or left. Then, fix the sensor in the center of position where the stability is operating.

● Object(Copper wire) detection <Micro spot type>

※Mount the sensor slanted at an angle ranged 0 to 15° shown above as [Figure 2] for stable detection to detect as shown in [Figure 1].

■ Sensitivity adjustment

Order	Position	Description
1	(A) MIN. MAX.	Turn the adjustment VR to the right of min. and check position(A) where the operation indicator is turned ON in "Light ON status".
2	(A) (C) (B) MIN. MAX.	Turn the adjustment VR more to the right of position(A), check position(B) where the operation indicator is turned ON. And turn the adjustment VR to the left, check position(C) where the operation indicator is turned OFF in "Light OFF status". ※If the operation indicator is not turned ON although the adjustment VR is turned to the max. position, the max. position is (C).
3	Optimal sensitivity (A) (C) MIN. MAX.	Set the adjustment VR at the center of (A) and (C). To set the optimum sensitivity, check the operation and lighting of stability indicator with sensing target or without it. If the stability indicator is not turned ON, please check the sensing method again because sensitivity is unstable.

※No sensitivity adjustment function available for BJJ30-DDT models.

	Light ON status	Light OFF status
Through-beam type	Emitter Receiver	Emitter Sensing target Receiver
Retro-reflective type	Receiver Reflector	Sensor Sensing target Background object
Diffuse/Narrow beam/BGS reflective	Sensor Sensing target Background object	Background object

※Set the sensitivity to operate in stable light ON area and the reliability for the environment (temperature, voltage, dust etc) is increased. In unstable light ON area, be sure that the variation of environment.

※Do not apply excessive force on the adjustment VR, it may be broken.
